

The Echidna

geschrieben von

Jan Kröhmer

The Echidna is a animal who looks like an hedgehog(igel) with a long nose and a long spines(stacheln) The Echidna is a kind of monotremes. They are 35 cm long and 2.7 to 7 kilogram heavy. There look like a sweet hedgehog with long spines(6cm). The belly(bauch) is unprotected.

You can find Echidna all in Austria and New Guinea(Desert region,Wood region,parkland). The echidna is a single, only in the mating season does it meet for mating,and their eat small marsupial,earthworms (Regenwürmer,Ants and Temite.

If they feel threatened, they dig into the earth very quickly. They then wedge with the strong limbs, leaving only the spiky top protruding from the floor. There threatend by: Red fox,dingo and "Buntwaranen"
